Dessalination

Equipment Specs Sheet Sea Water ECO1000

The separation of salts in a liquid / liquid operation through the use of membranes is an operation that already has 40 years of experience and proven operation in the market. It progressively gains its preference among users over demineralization systems and other older technologies.

Its greatest benefits are continuous, uninterrupted production of constant quality.

These days, in order to meet the cost and quality requirements of end customers, these are your main competitive advantages.

Membrane separation has 4 main types of products:

- Microfiltration
- Ultrafiltration
- Nanofiltration
- Reverse Osmosis

This division is directly related to the membrane porosity and therefore the particle size that allows it to pass through it (see figure). Depending on your application, the membrane and the type of equipment to be used will be chosen.

The use of seawater unit has input conductivity of 55 000 μ S/cm².

REVERSE OSMOSIS OPERATION

Permeate Flow	10,00 m ³ /h	
Inlet Flow	22,20 m ³ /h	
Concentrate Flow Rate	12,20 m ³ /h	Inlet
Recovery	45 %	
Project Temperature	18 ºC	
Project pH	5,5 - 8,5	↓ ↓
Minimum Inlet Pressure	3 bar	Energy Recovey
Operating Pressure	52,1 bar	Ļ
		Concentrate
